Release 2024.6 [29/04/2024-]

General Overview & Impact

🔐 This release builds on the Security Deposit functionality created by our colleagues at FIT, for use in the UAE market. The new functionality will automatically refund a security deposit back to the resident, upon moving them out of the property.

👷 This release contains the initial work completed for custom emergency credit limits, and friendly disconnect periods in Mabdeck. This functionality will be available for users who have an Orbit solution installed in their properties. The first lot of the work includes the ability to add a custom friendly disconnect configuration to Mabdeck, which later can be applied to hubs in PAYG mode, as well as a custom emergency credit limit configuration. Although this work will be hidden for a while until it is all available, this will be tested in the background as more functionality is added, until it is all ready for the customer to use.
